

### The smart choice for effective sowing

Incotec's pelleting and encrusting products increase the efficiency of automated sowing processes and deliver smooth-surfaced seeds with optimal size and weight. Our coatings keep their components contained and are the ideal carriers for plant protection products, nutrients and biologicals. Coated seeds take on a quality appearance and for extra appeal an optional visual effect can be added.

Incotec has in-depth knowledge of seed biology, application techniques and chemistry.

As part of Croda, we have access to leading formulation technology which enables advanced and innovative film coats and coatings. Our products are carefully tailored to the unique and specific needs of the crop.

All over the world, Incotec offers smart solutions, adapted to local needs and conditions.

#### Benefits of Incotec's coatings

- Optimal seed protection
- Increased efficiency and precision
- Tailored to each seed species
- Direct seed application of plant protection products
- Compatible with other Incotec technologies
- Enables accurate monitoring of sowing result

#### Encrusting

A powder, adhesive and film coat create a thin coating layer around the seed, keeping the seed shape visible. The thickness can be adapted to suit your needs. The process is shorter and more automated than pelleting.

#### Pelleting

Pelleting makes sowing more efficient. The coating acts as a barrier and protects seeds from potential phytotoxicity. There are two types of pellet: one splits open on contact with water, the other disintegrates. Both allow direct seed-access to moisture, oxygen and light. Whatever your crop conditions, we have a pellet to suit your needs.
